

Body Scan Practice Companion

A gentle sensory-awareness practice for people living with Parkinson's

Prepare

- Choose a stable, comfortable seated or lying position.
- Let your hands rest and soften your gaze or close your eyes.
- There is no need to change any sensation. The practice is simply to notice.

Practice

- Begin by noticing the contact between your body and the chair, bed, or floor.
- Move attention slowly from the feet upward, noticing pressure, temperature, tingling, movement, or areas with little sensation.
- When attention wanders, return gently to the current body area.
- End by sensing the body as a whole and taking one comfortable breath.

Adapt

- Shorten the scan to one or two body regions on low-energy days.
- Keep the eyes open if closing them feels uncomfortable.
- Pause whenever symptoms, fatigue, or discomfort increase.

Important

This guide is educational and does not replace medical care. Adapt or stop the practice if you feel uncomfortable, and consult your healthcare team about individual safety needs.
